Exp No:11

Implementing Security Features and Governance / Administration Practices in Zoho Creator

Aim

To implement security features and governance practices in Zoho Creator to protect application data, manage users and ensure secure and controlled application access.

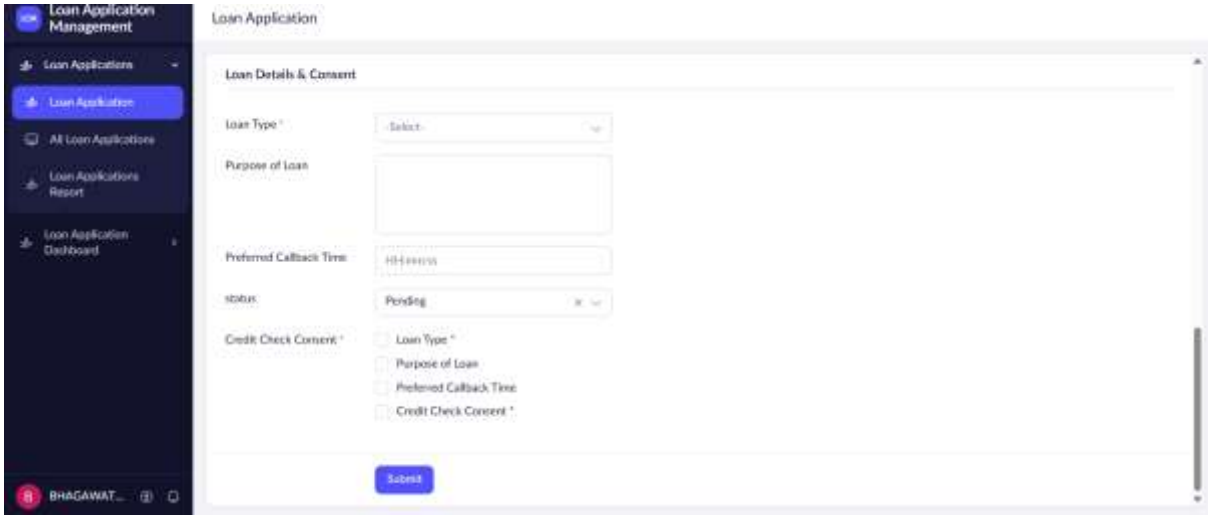

Record Status

Completed after configuring and testing the security and administration settings.

Concept

Security and governance in Zoho Creator involve protecting application data, controlling user access, and managing application resources according to organizational requirements.

Important security features include role-based access control (RBAC), user permissions, record-level access restrictions, data validation, and secure management of workflows and integrations. Governance practices help administrators maintain application reliability, consistency, and compliance with organizational policies.

Procedure

1. Log in to Zoho Creator and open the Loan Application Management System.
2. Navigate to the application settings and identify the available security and administration options.
3. Configure user roles such as Administrator, Loan Officer, and Applicant.
4. Assign appropriate permissions to forms, reports, and application functions.
5. Restrict access to confidential information, including PAN numbers, contact details, and residential addresses.
6. Configure record-level access so applicants can access only their permitted records.
7. Enable required-field validation and appropriate input restrictions.

8. Review workflows and Deluge scripts to ensure that unauthorized updates cannot occur.
9. Review user access and remove unnecessary permissions.
10. Test the application using accounts with different roles to verify the security configuration.

Application Design

The Loan Application Management System applies the following security and governance practices:

- **User management:** Controls authorized application users.
- **Role-based access control:** Assigns permissions according to user responsibilities.
- **Record-level security:** Restricts access to loan application records.
- **Data validation:** Prevents invalid or incomplete information from being submitted.
- **Administrative control:** Allows authorized administrators to manage application settings and users.
- **Workflow governance:** Ensures that application status changes follow the defined business process.
- **Data protection:** Limits access to sensitive applicant information.

Observations

1. Role-based permissions help prevent unauthorized application access.

2. Record-level restrictions protect confidential applicant information.
3. Input validation improves data quality and consistency.
4. Administrative controls simplify application management.
5. Regular security reviews help identify unnecessary permissions and configuration issues.

Validation and Discussion

Test the application using different user roles. Verify that administrators can perform authorized management tasks, loan officers can access permitted application records, and applicants cannot access other applicants' information.

Attempt to access restricted reports and records to confirm that the configured permissions are enforced. Check that invalid data is rejected and that unauthorized status changes are prevented.

Security depends on the actual permissions, sharing rules, and account features configured in Zoho Creator. These controls must be tested before the application is considered secure.

Result

Thus, security features and governance practices in Zoho Creator were studied and configured to support secure user access, protect application data, and maintain effective administration of the Loan Application Management System.
