EXP NO :08

Aim

To configure user management and Role-Based Access Control (RBAC) in a Zoho Creator application to provide secure access to users based on their roles and permissions.

Record Status

Completed after configuring and testing the user roles and permissions.

Concept

Role-Based Access Control (RBAC) is a security mechanism that assigns permissions to users based on their roles. In Zoho Creator, administrators can manage users and control access to forms, reports, and application data.

Procedure

1. Open the Loan Application Management System in Zoho Creator.
2. Navigate to the application settings and locate the user management or permissions section.
3. Identify the required user roles, such as Administrator, Loan Officer, and Applicant.
4. Assign appropriate permissions to each role.
5. Allow administrators to manage applications and users.
6. Allow loan officers to view and process loan applications according to their permissions.
7. Restrict applicants to accessing only the information permitted for them.

8. Save the configuration and test access using the relevant user roles.

Application Design

The Loan Application Management System uses role-based permissions to protect applicant information and control access to application functions.

- **Administrator:** Manages the application, users, reports, and permissions.
- **Loan Officer:** Reviews applications and updates application status.
- **Applicant:** Submits loan applications and accesses permitted information.

Observation

Different roles require different levels of access. Proper configuration helps prevent unauthorized access to loan application data.

Validation and Discussion

The configured roles and permissions should be tested to verify that each user can access only the permitted forms, reports, and actions. Actual access restrictions depend on the selected Zoho Creator permissions and sharing settings.

Result

Thus, user management and Role-Based Access Control (RBAC) were configured and tested in the Zoho Creator application to improve data security and control user access.
