EXP NO :09

Exploring AI-Assisted Features and Built-in Analytics (Zia) in Zoho Creator

Aim

To explore AI-assisted features and built-in analytics using Zia in Zoho Creator to improve data processing, application development and decision making.

Record Status

Completed after exploring the available Zia AI features and built-in analytics in Zoho Creator.

Concept

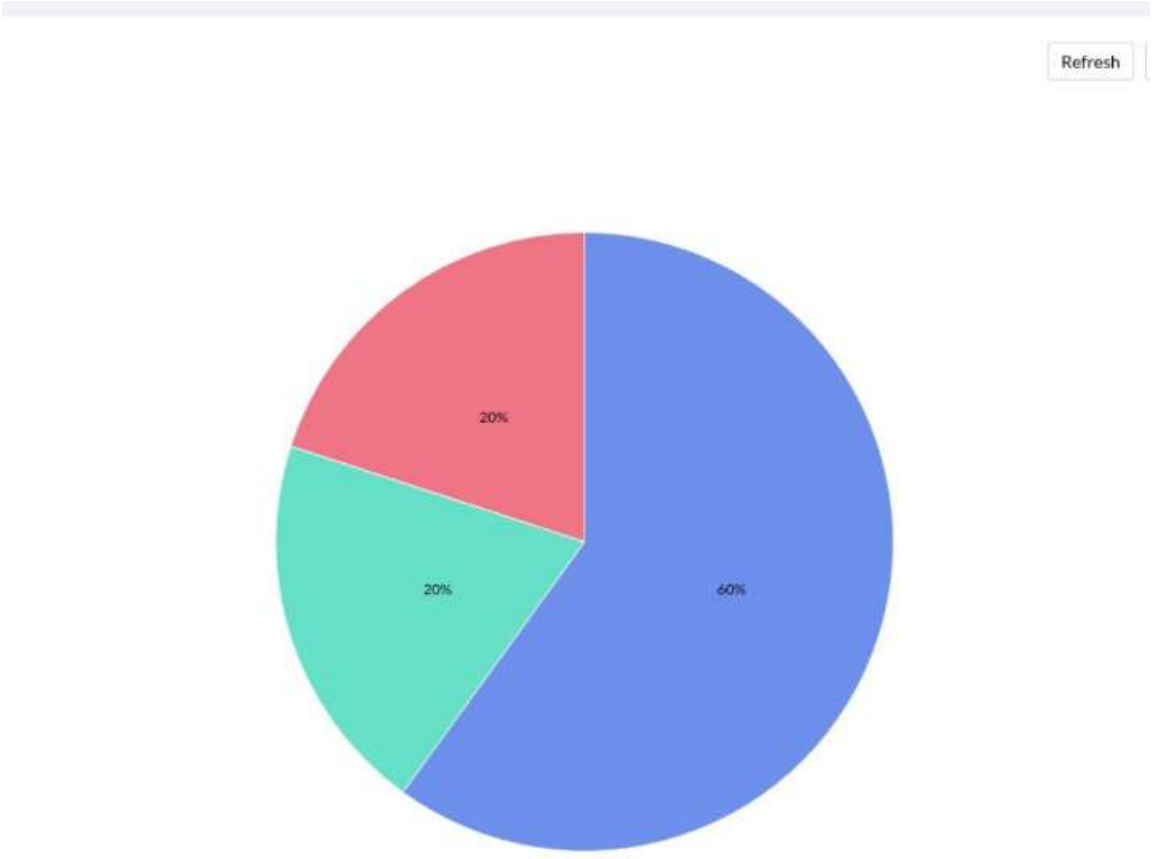

Zia is Zoho's AI assistant that helps users develop applications, analyze data, and gain insights. In Zoho Creator, Zia can assist with application creation, data analysis, predictions, keyword extraction, sentiment analysis, and other AI-powered features, depending on the available plan and configuration.

Built-in analytics helps users understand application data through reports, charts, dashboards, and summaries. These features support faster analysis and better business decisions.

Procedure

1. Log in to Zoho Creator and open the Loan Application Management System.
2. Explore Zia's AI-assisted application creation features.
3. Examine the available AI field options, such as Prediction, Keyword Extraction, Sentiment Analysis, OCR, and Object Detection.

4. Explore the available AI features and select an appropriate feature for the application.
5. Create or configure reports to display loan application data.
6. Use charts and dashboards to summarize applications by status and loan type.
7. Examine the available analytics and insights provided by Zoho Creator.
8. Test the configured features using sample loan application records.
9. Verify the displayed results and record the observations

Application Design

The Loan Application Management System uses AI-assisted features and built-in analytics to improve application processing and reporting.

- AI-assisted development: Zia helps generate application structures and provides development assistance.
- AI fields: Available AI fields can process supported inputs for tasks such as keyword extraction and prediction.
- Reports: Display loan application details, including applicant information, loan type, and status.
- Charts: Visualize the distribution of Pending, Under Review, Approved, and Rejected applications.
- Dashboard: Presents important application statistics in a single view.
- Decision support: Reports and analytics help administrators and loan officers monitor applications and identify processing trends.

Observations

1. Zia can simplify application development through AI-assisted features.
2. AI fields support specific data-processing tasks depending on the selected feature.
3. Reports and charts make large amounts of application data easier to understand.
4. Dashboards help administrators monitor loan application statuses.
5. The accuracy of AI-generated results depends on the input data, configuration, and available features.

Validation and Discussion

The configured AI features and analytics should be tested using sample records. Verify that reports display the correct data and that charts represent the application statuses accurately.

For AI-assisted features, check whether the generated output matches the intended task. Any predictions or extracted information should be reviewed before being used for business decisions.

The availability of Zia features may vary depending on the Zoho Creator plan, permissions, and application configuration.

Result

Thus, AI-assisted features and built-in analytics using Zia in Zoho Creator were explored to understand their role in application development, data processing, visualization and business decision-making.
